

THE GLOBAL GREENHOUSE

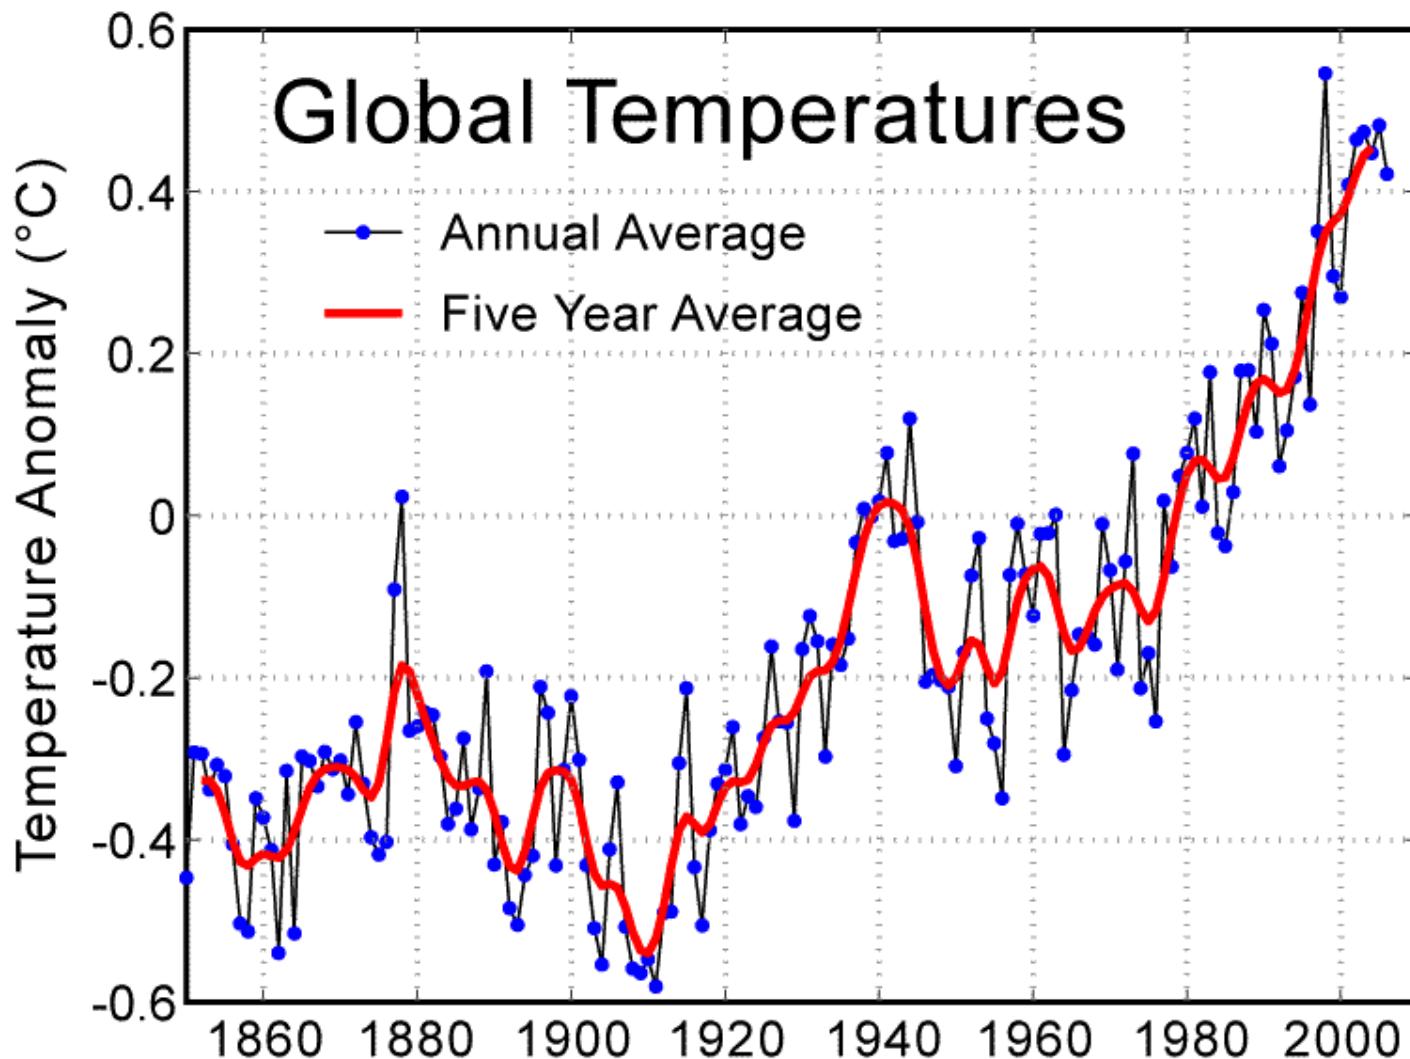

FEEM Nov 27, 2014

- recent heating and reliability of measurements
- earth heat balance and greenhouse effect
- past and future of atmospheric CO₂
- are we the cause
- the new commandment

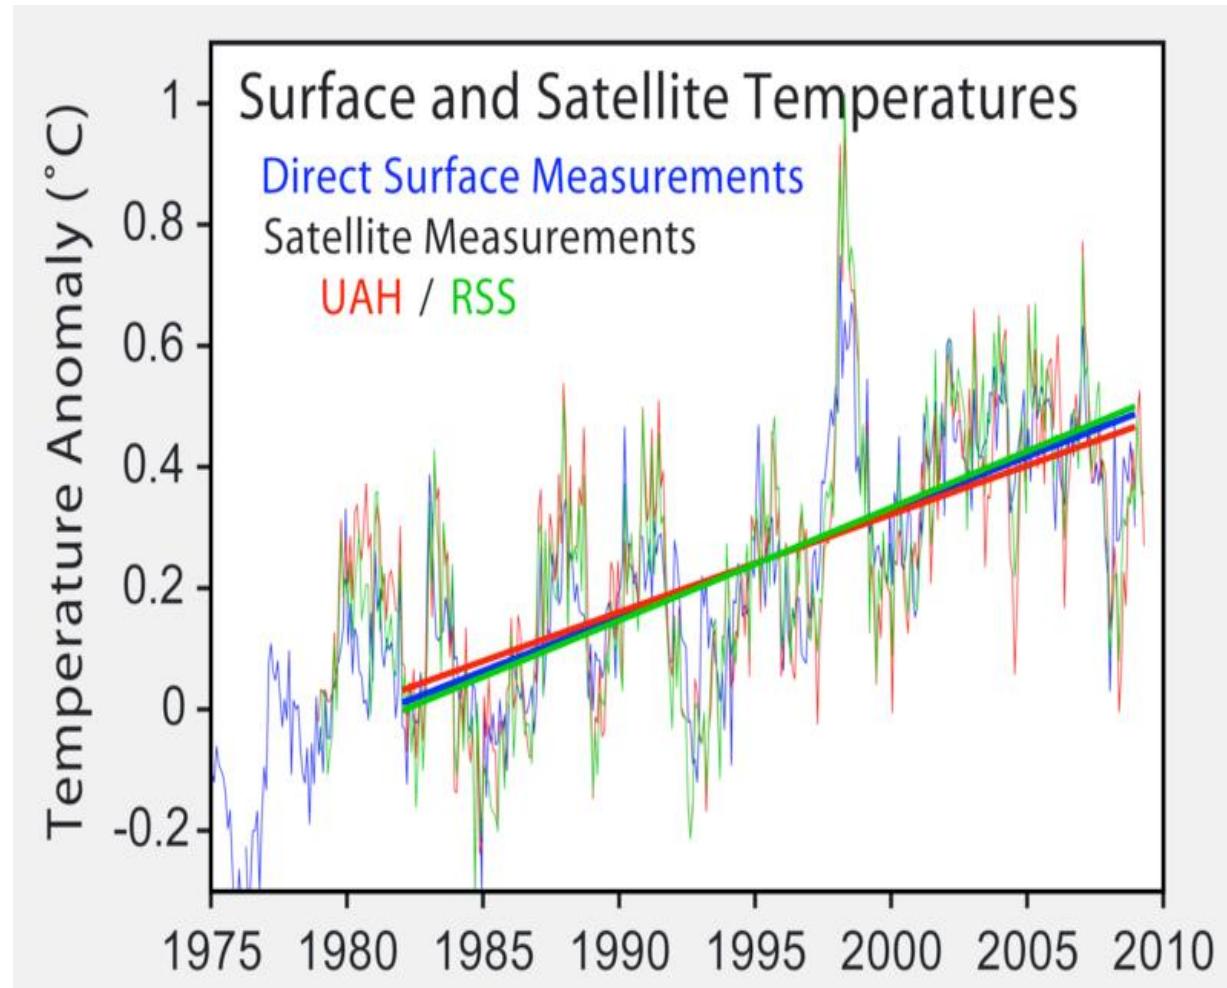

Temperature recent history

+ 0.8 °C in the last century

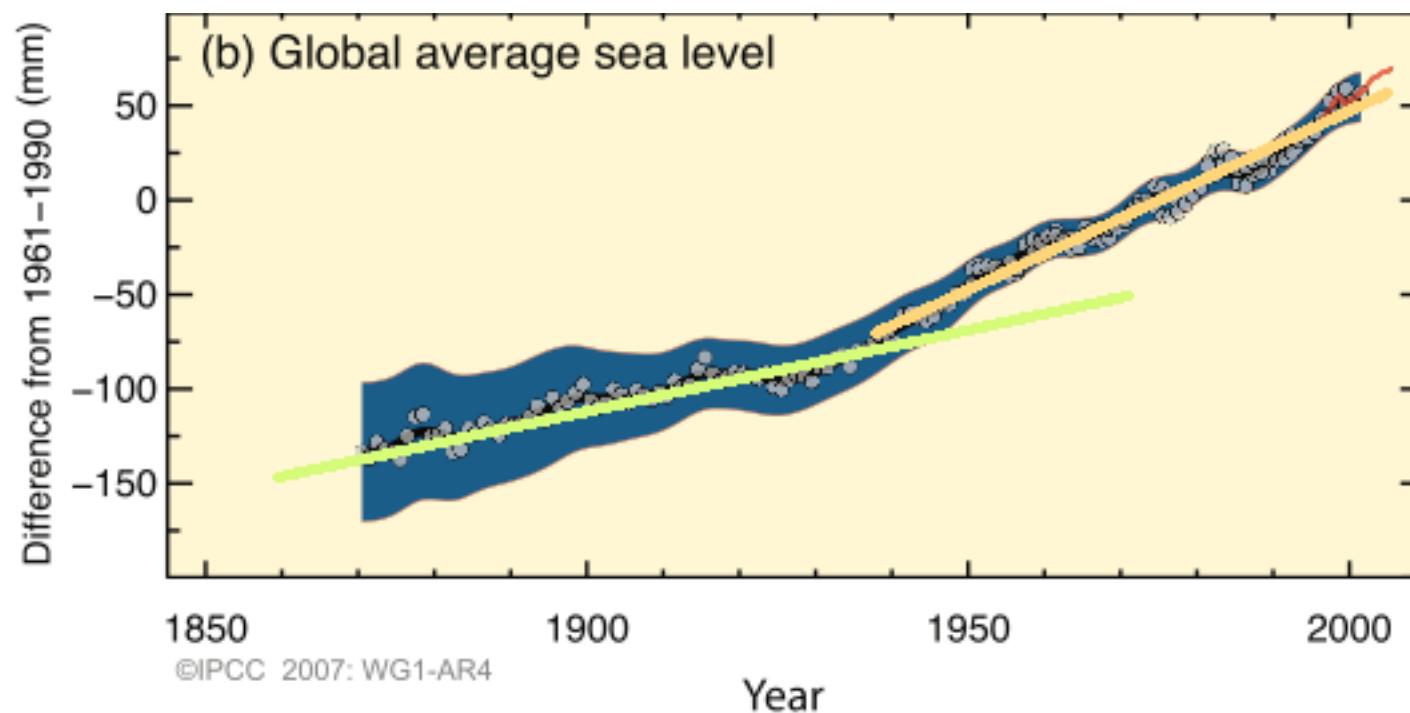

Should we trust the measurements? Satellite and land measurements agree

- thousands of thermometers
- sea level
- ice melting
- plant blooming
- migration dates
- UAH Univ of Alabama
- RSS Remote Sensing NASA

Sea Level

1.8×10^3 mm/year (NOAA)

IPCC AR5

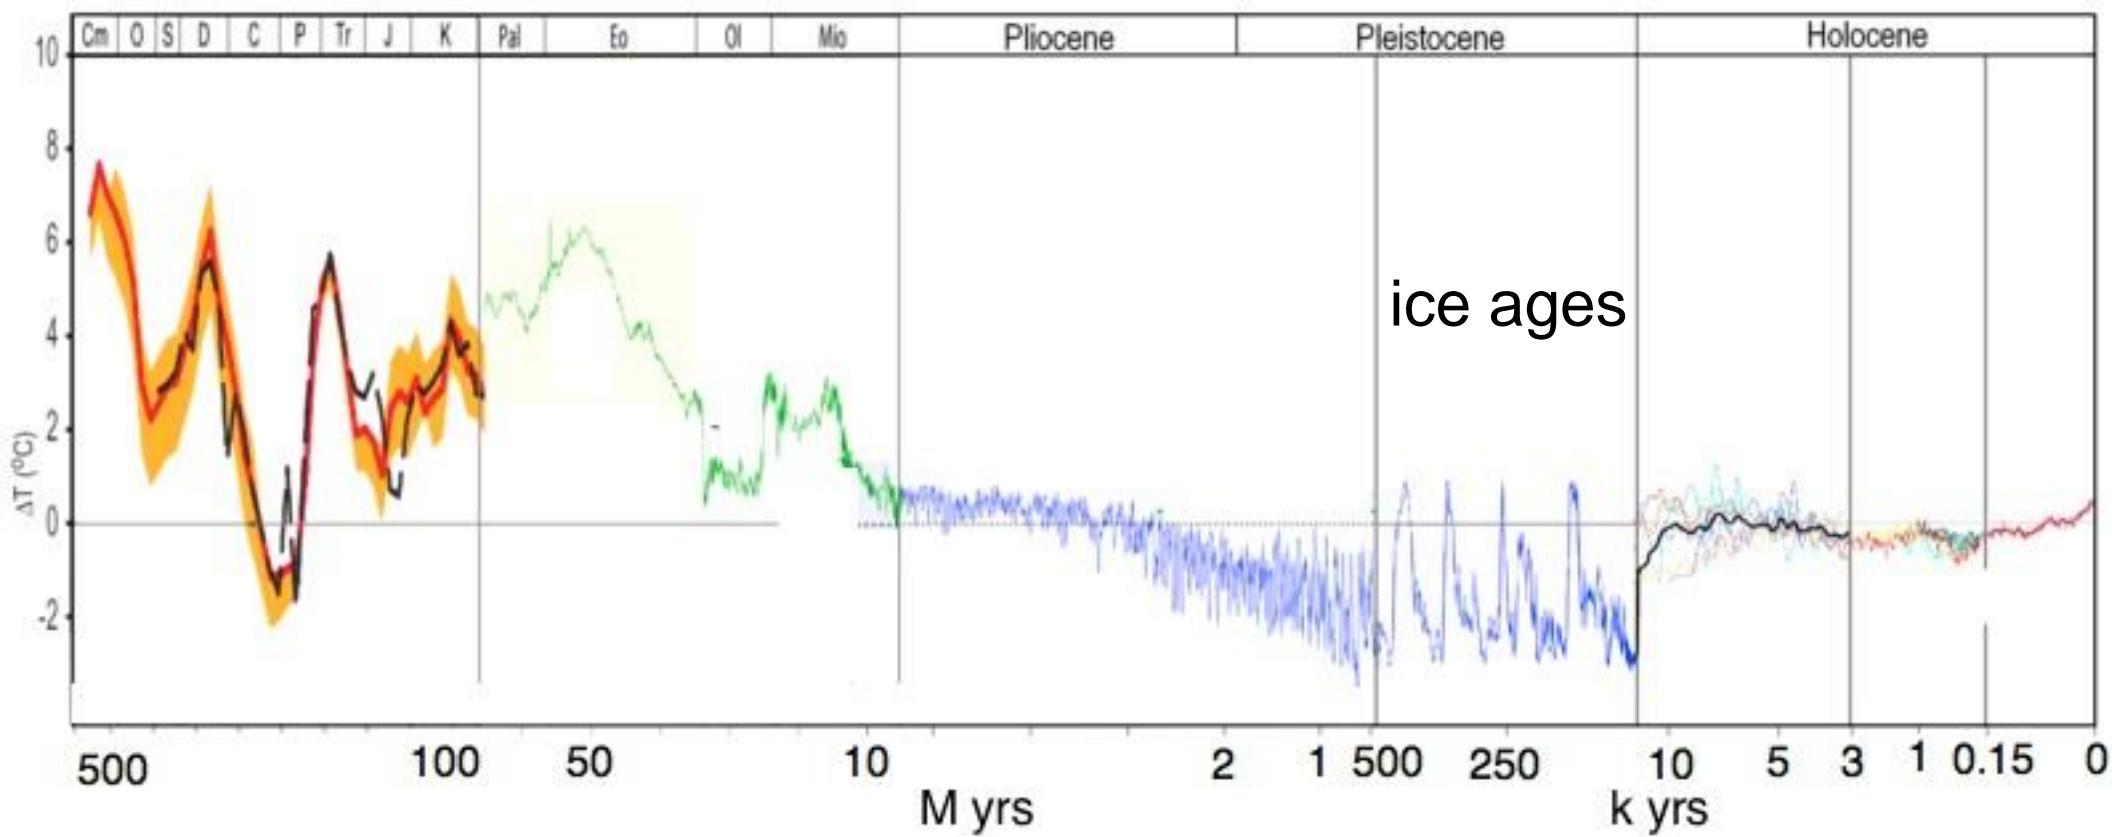

UNEQUIVOCALLY WARMING

Anthropogenic cause extremely likely (95%)

<http://www.ipcc.ch>

Long Term T

log x-scale

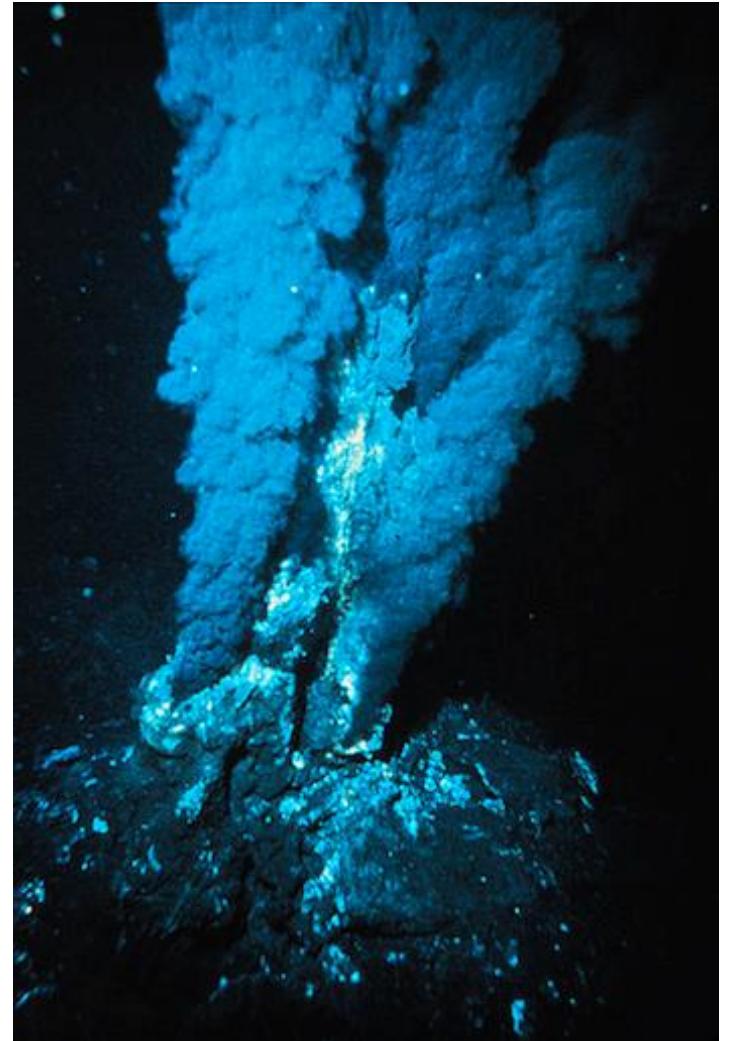

EARTH

- 5 billion years
- 8 min-light from sun
- Radius = 6,000 km
- 99% T>1000 C
- crust (5 to 50 km, < 1%)
- mantle (3000 km, water, 500 C to 4000 C)
- molten metal core
- oceans
- atmosphere

the crust

- mostly solid - good insulator
- tens of 10^9 years to cool
- radioactive decay 30 TW
- 44 TW or 65 mW/m^2 & 100 mW/m^2
- $P_{\text{solar}} \sim 340 \text{ W/m}^2$
- Primary Energy Usage $\sim 16 \text{ TW}$ or 2.5 kW/person
- $P_{\text{geo}} \sim .08 \text{ mW/m}^2$ or 6 W/head
- $P_{\text{metabolism}} \sim 50 \text{ W}$

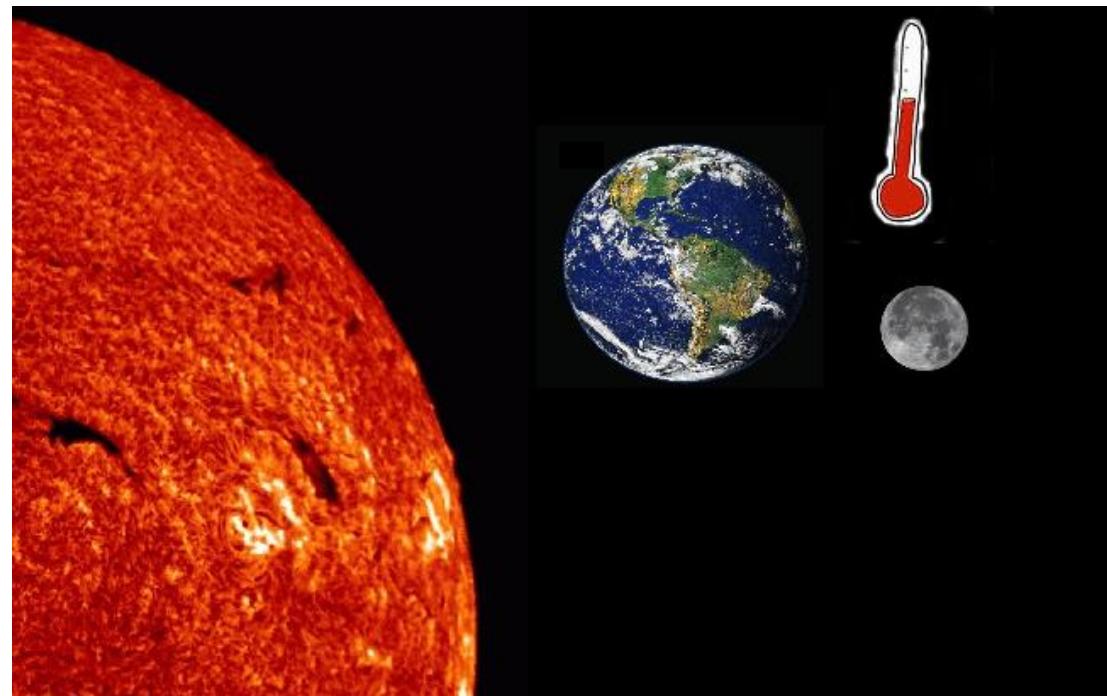

the biosphere

- soil
- seas .023% of the earth
- atmosphere (10 km) $<10^{-6}$ of earth mass
- the most crucial layer for our survival
- 20% O₂, nicer temperatures, less radiation

SOLAR RADIATION

- $T_{\text{Sun}} = 5000 \text{ }^{\circ}\text{C}$
- Sun diameter .5 deg
- in free space 281 K (8 $^{\circ}\text{C}$)
- average temperature on earth 287 K (14 $^{\circ}\text{C}$)
- think in deg K not $^{\circ}\text{C}$, no neg T
- liquid H₂O in a narrow orbit radius range

EQUILIBRIUM

visible light heating

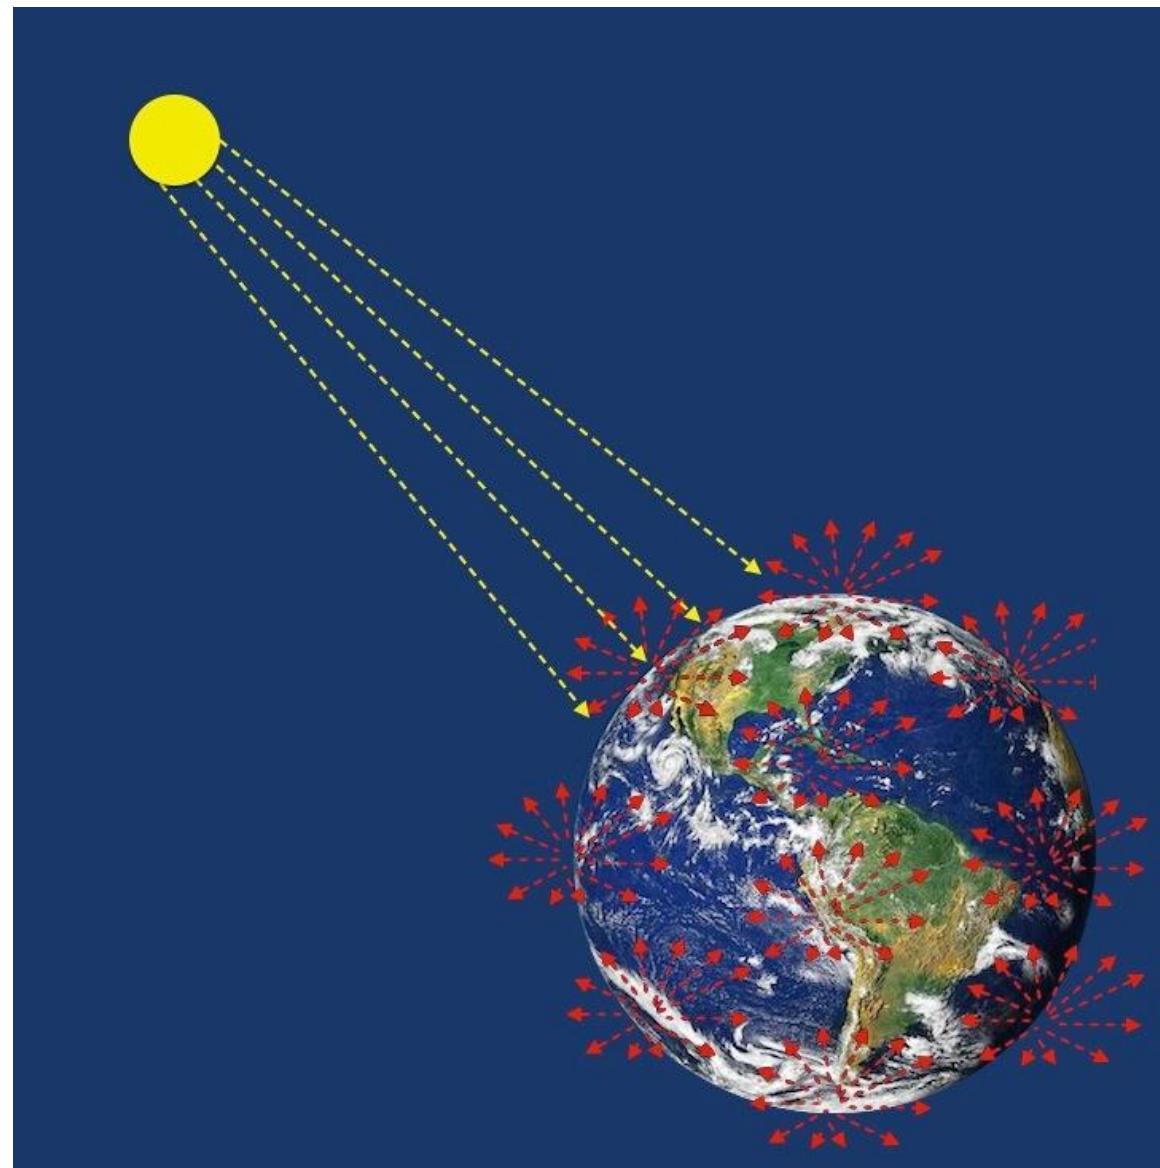

($\lambda \sim 1$ micron)

infrared cooling

($\lambda \sim 10$ micron)

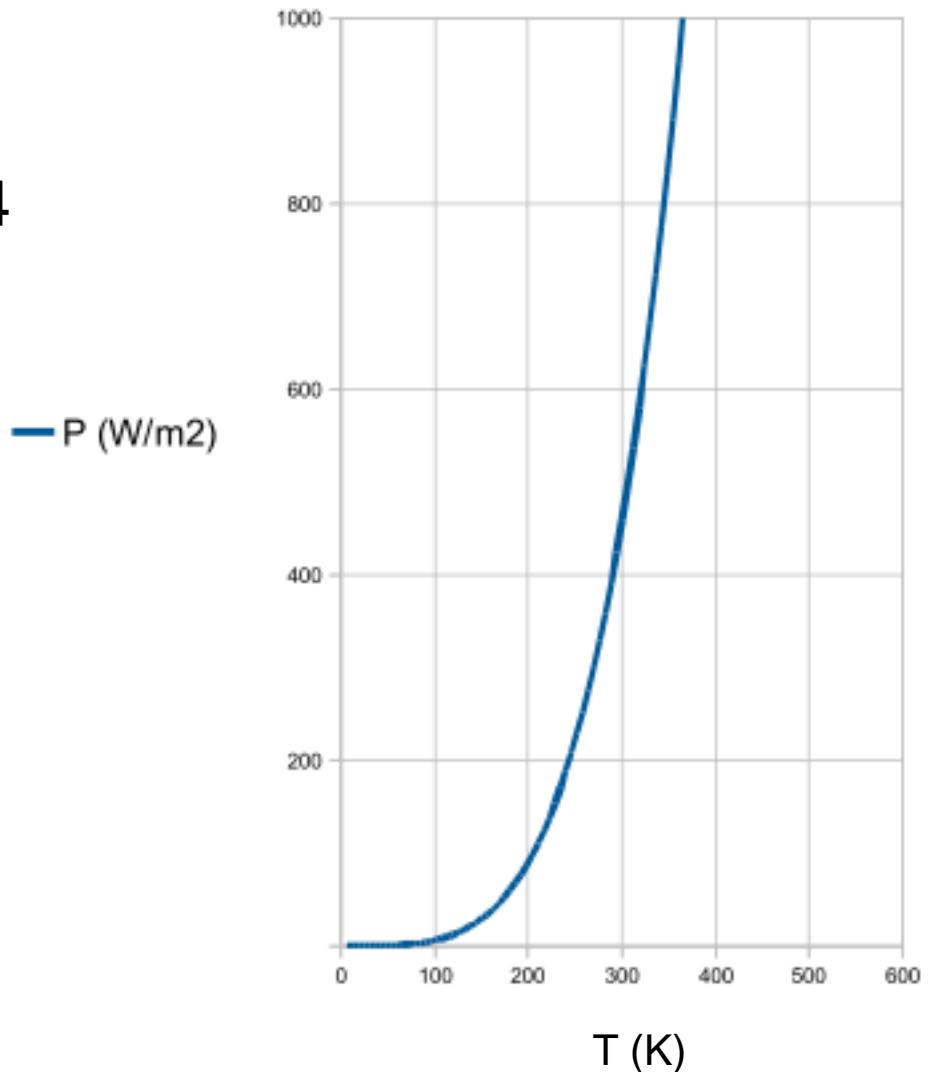

$$\lambda \sim 1/T$$

$P \propto T^4$ Stefan-Boltzman

THERMOSTAT

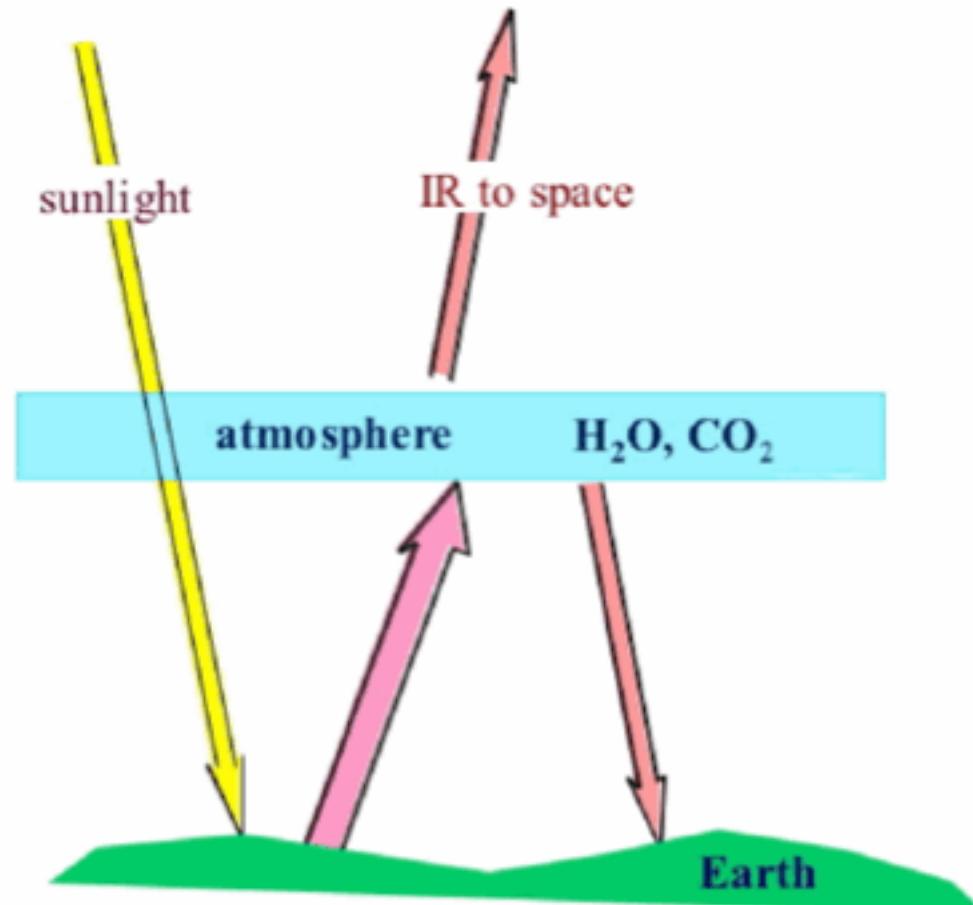

- Stefan-Boltzmann $P \propto T^4$
- Max sun power = 1300 W/m²
- Average on earth = 340 W/m²

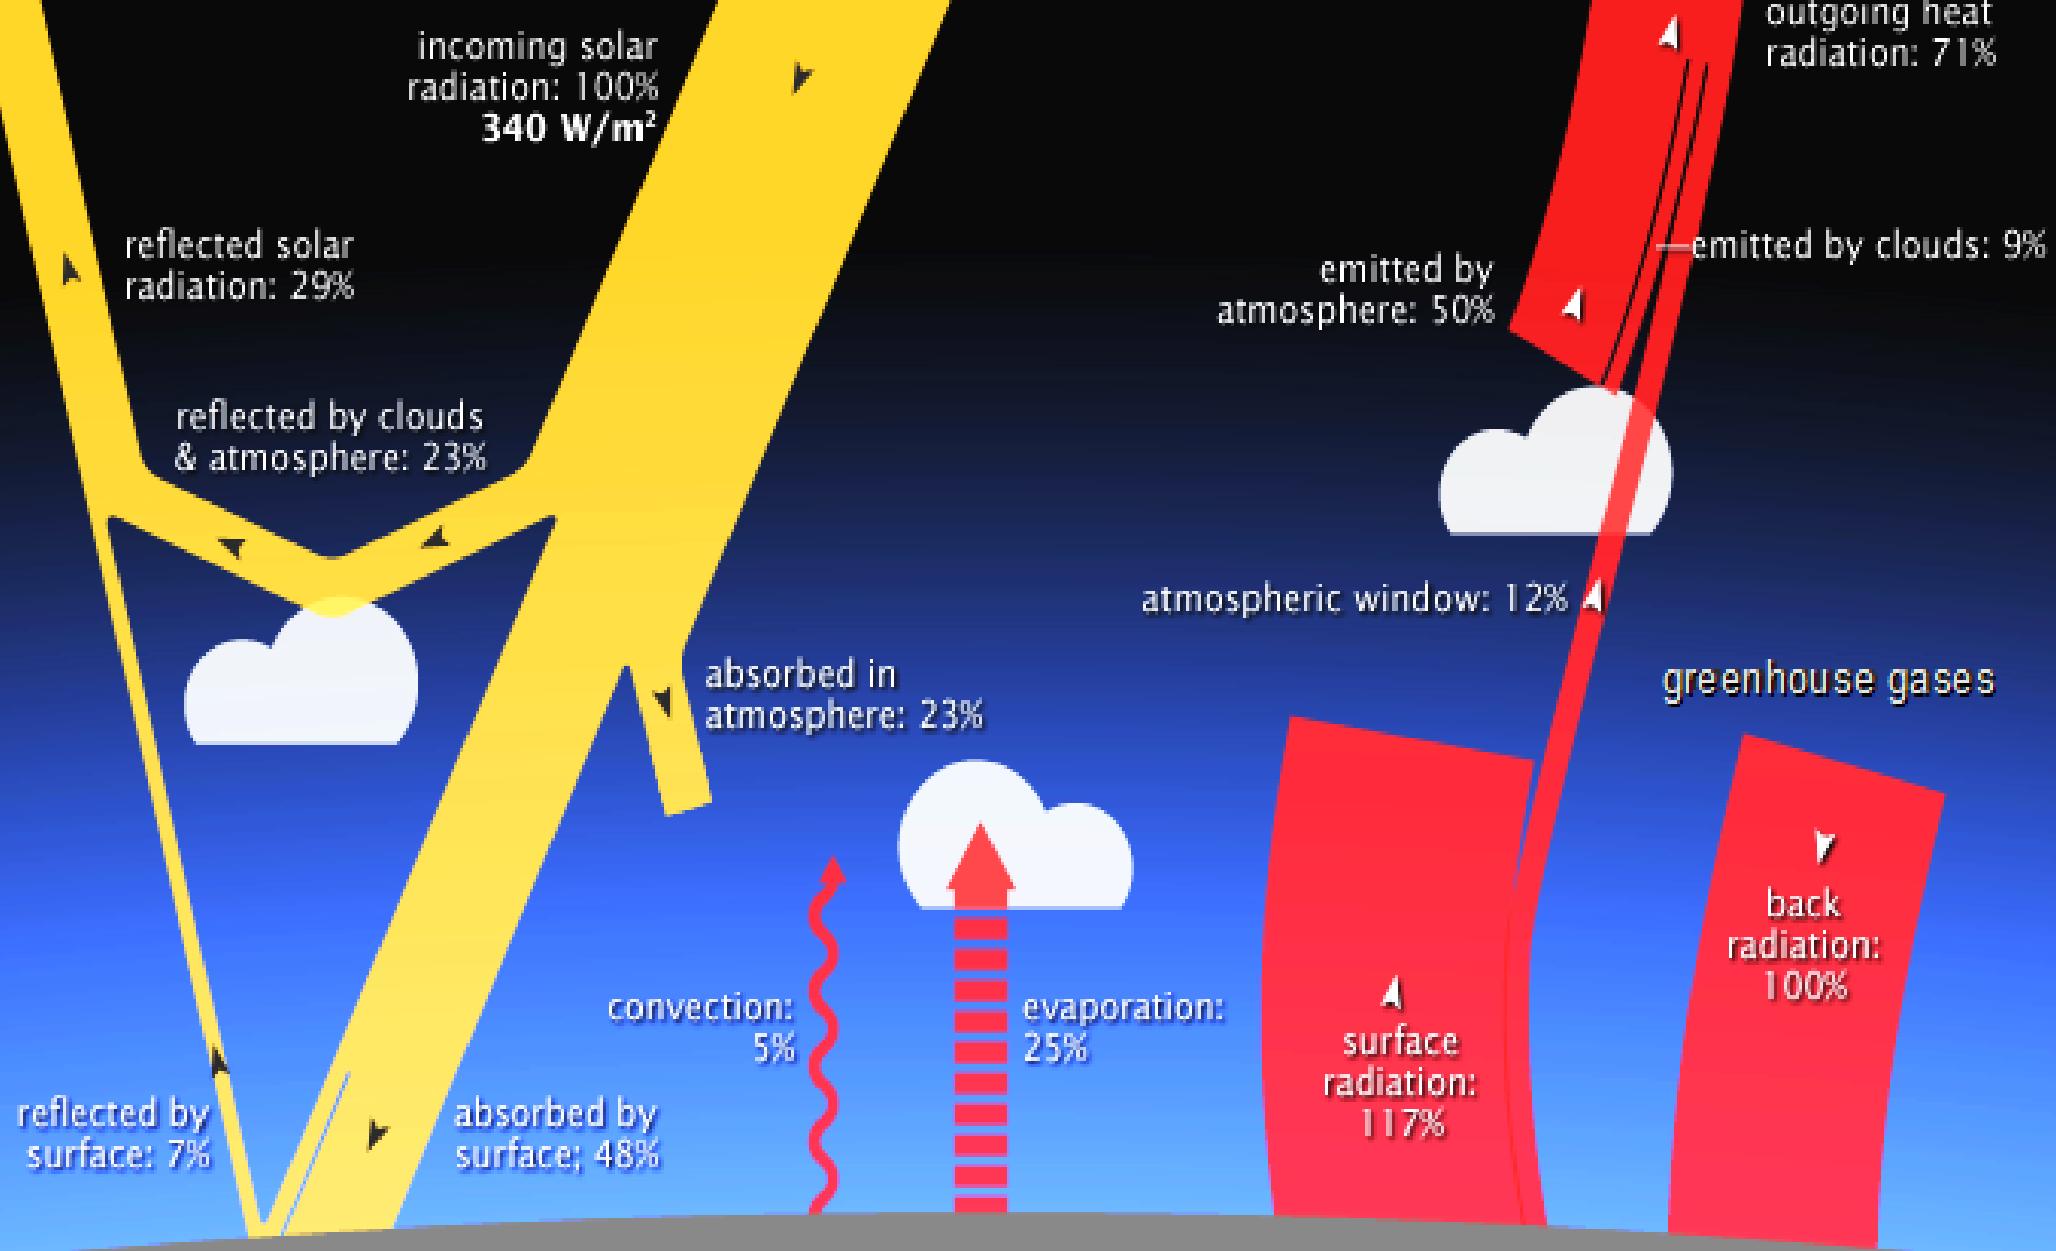

Greenhouse

visible light heating
($\lambda \sim 1$ micron)
infrared cooling
($\lambda \sim 10$ micron)

- Joseph Fourier 1824
- Svante Arrhenius 1896

a complex picture

no greenhouse T < 30 C - imbalance 0.58 W/m²

GREENHOUSE GASES

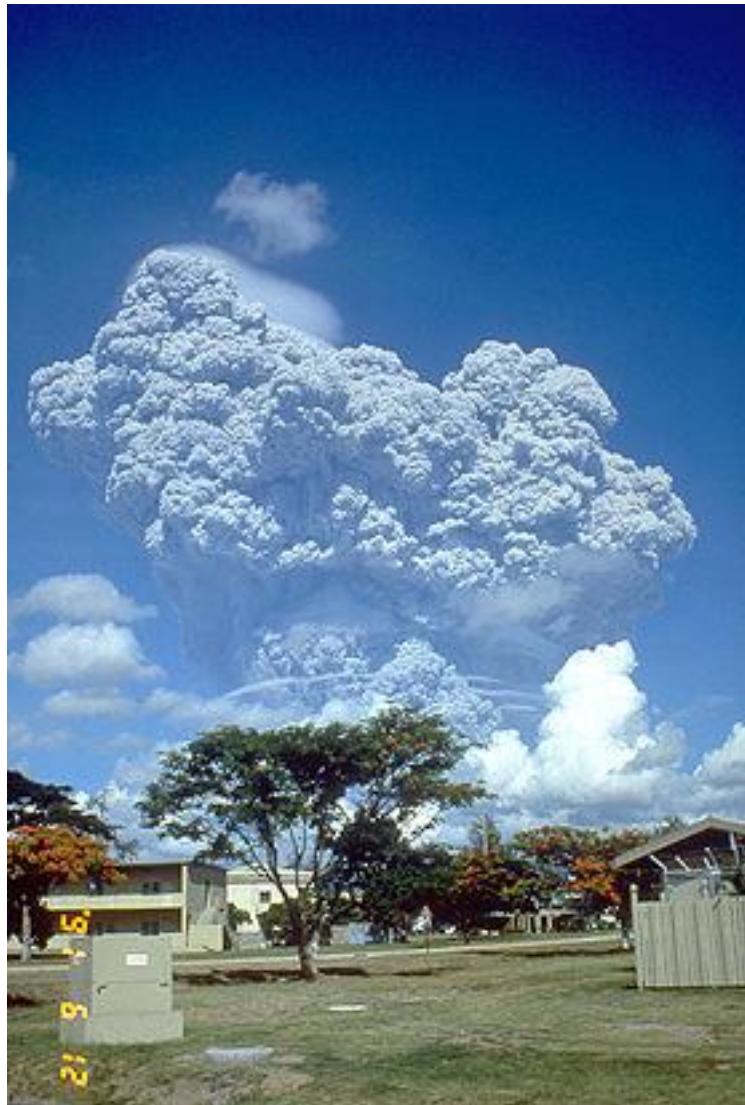

- water vapour and H₂O 36-72%
- CO₂ carbon dioxide 10-25%
- CH₄ methane 4-9%
- O₃ ozone 3-7%

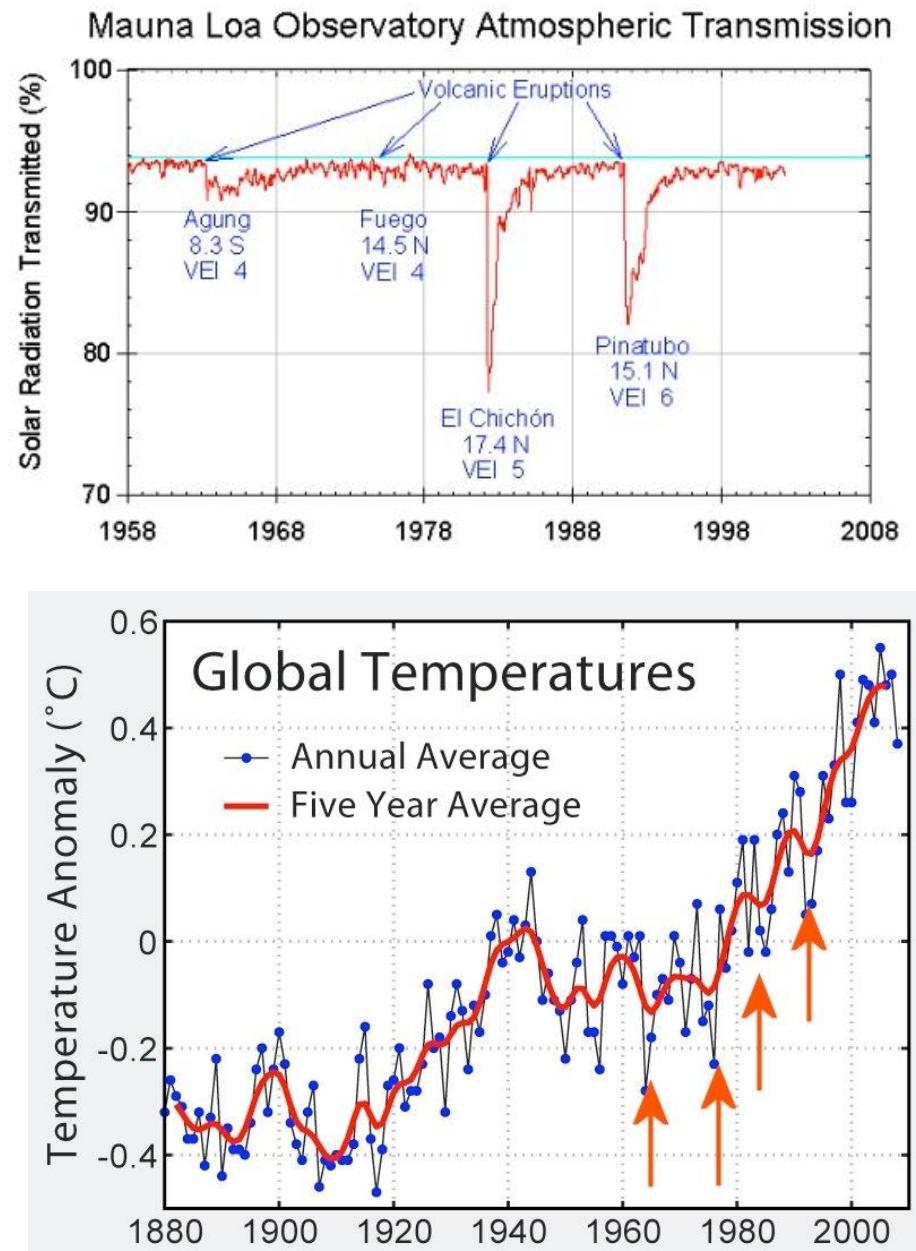

non gases:

- clouds
- aerosols
- clouds critically T dependent

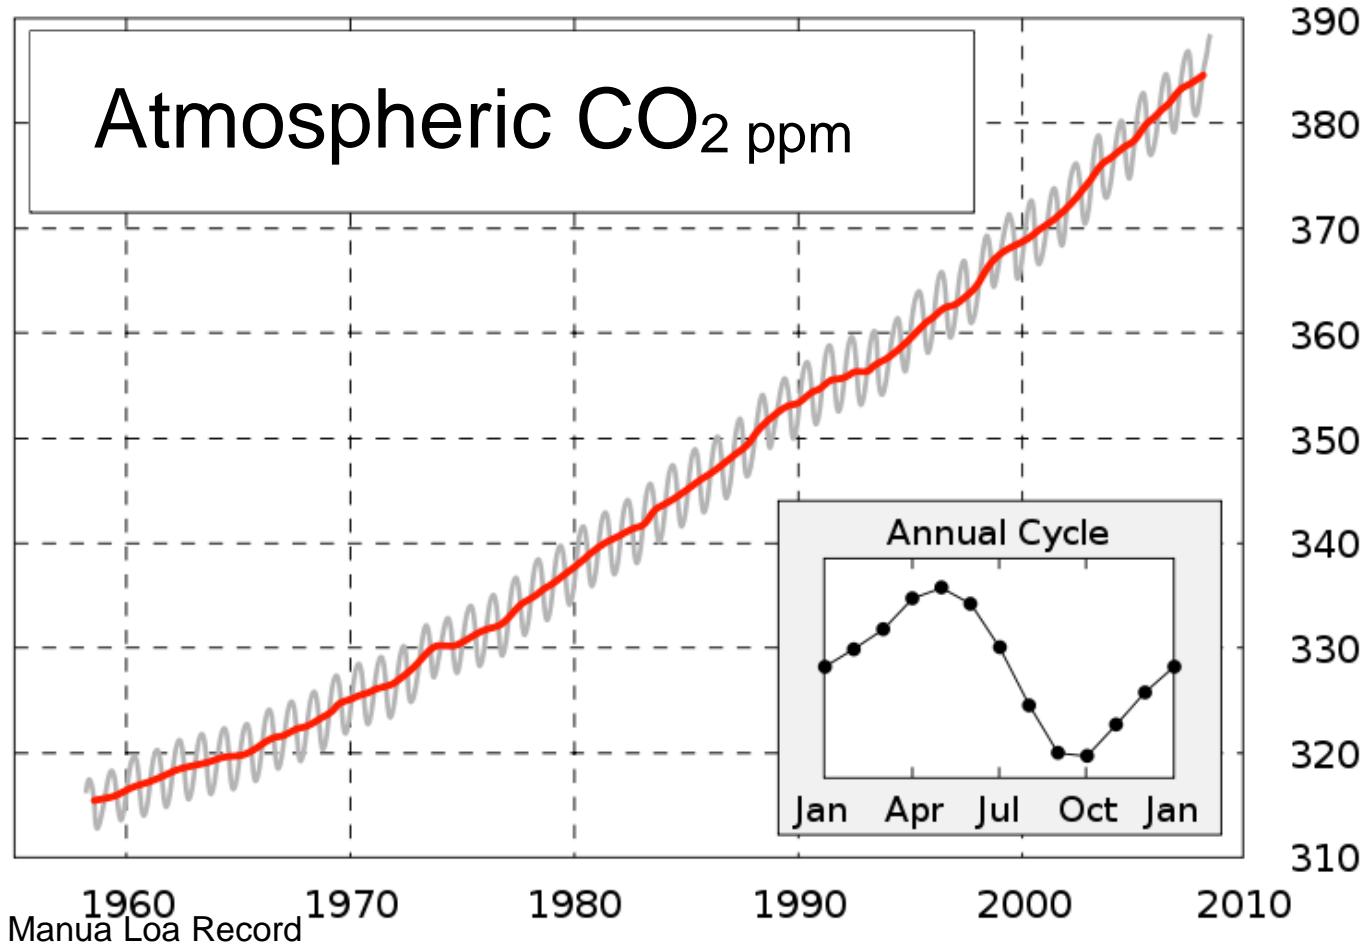

VOLCANIC ASH

Mount Pinatubo (Philippines) 1991

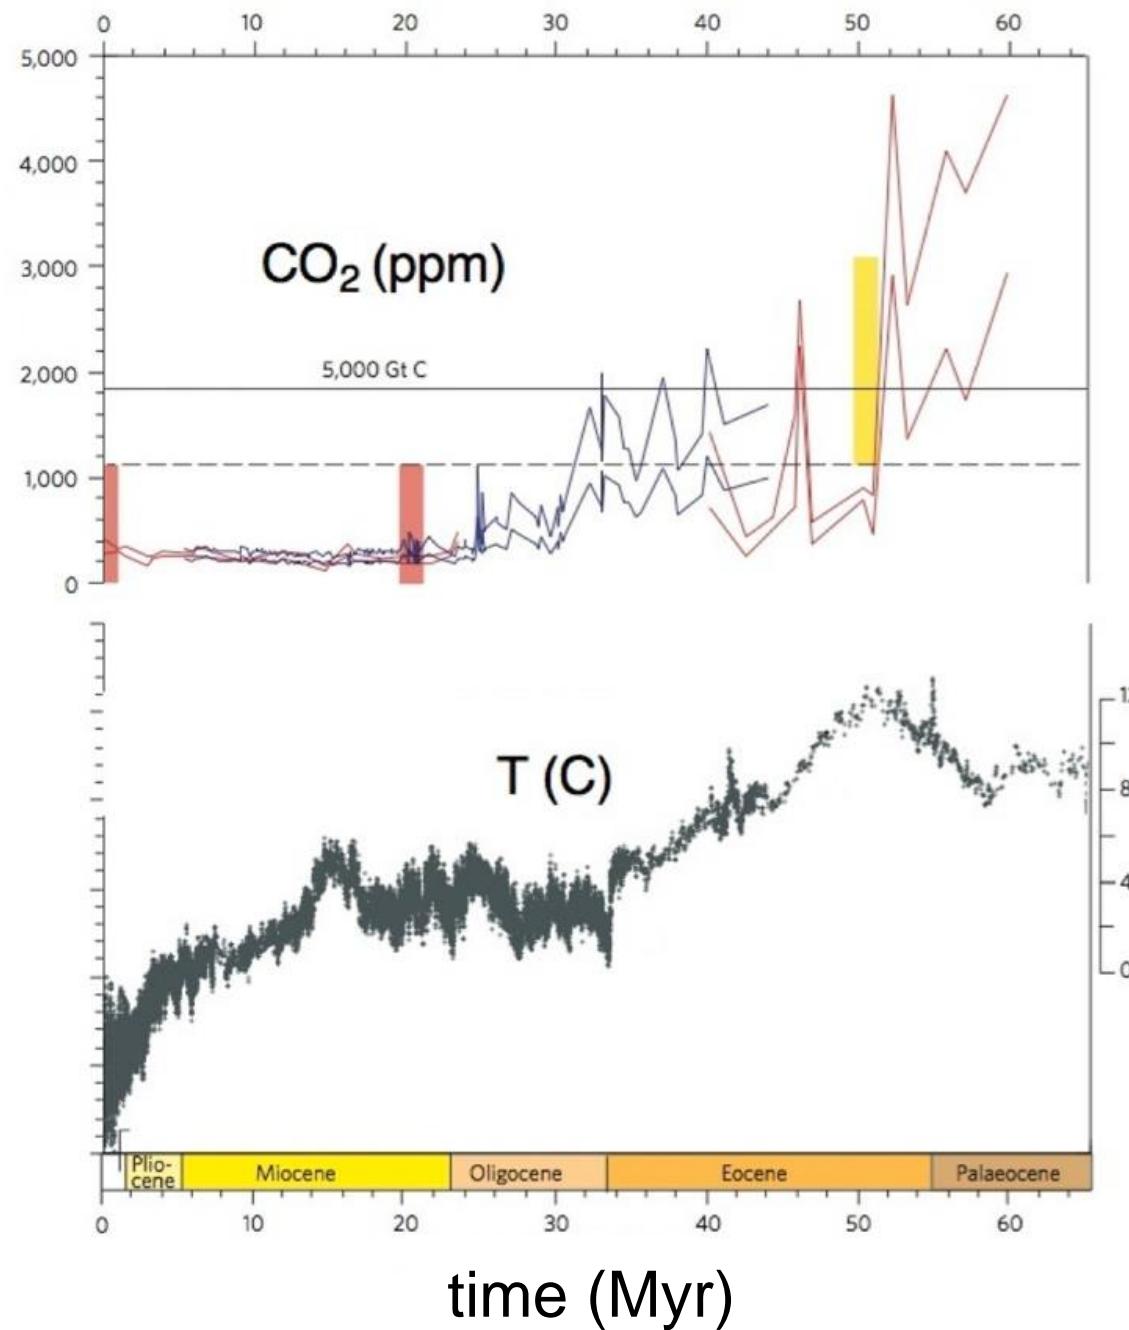

HYDROCARBONS and DEFORESTATION

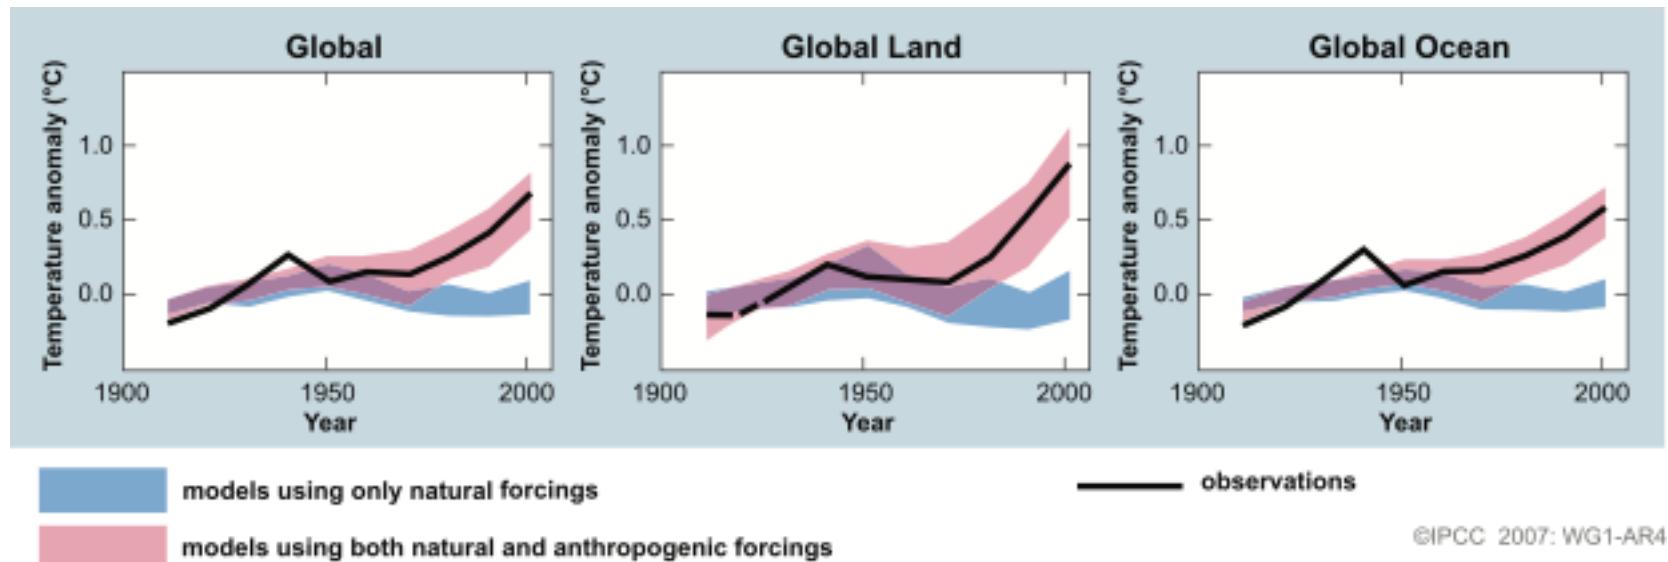

- yearly oscillation = northern hem metabolism
- average CO₂ mol lifetime = 12 years

CO₂ history

Our responsibility?

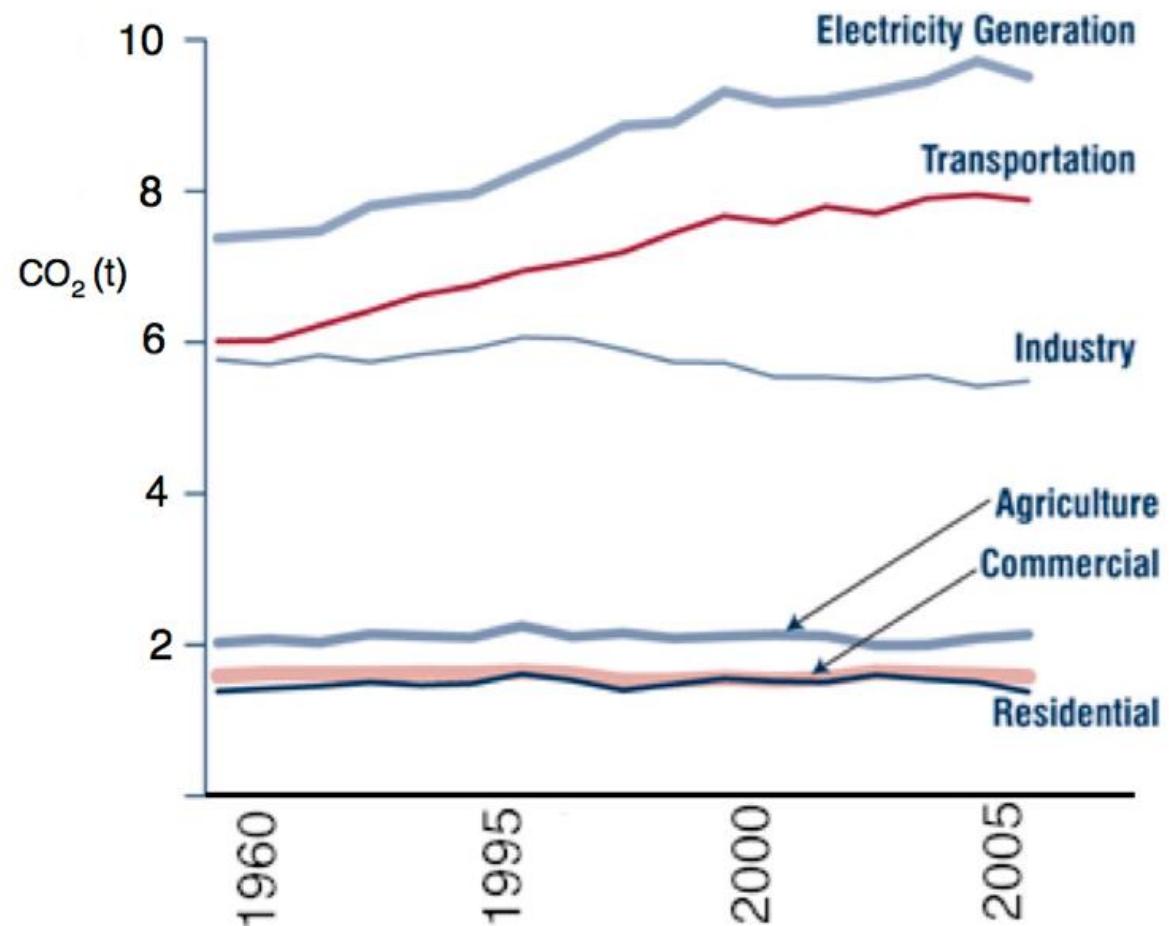

only a complex model can answer

details validate models:

- localised heating, like lower atmosphere vs high
- higher latitudes vs lower
- land vs seas
- nights relatively warmer than days

CO₂ emission

- electricity
- transports
- industry
- agriculture
- commerce
- domestic

a new entry in the 10 commandments

One Minute Calculator

[Austin Footprint Calculator Click Here](#)

For a much more comprehensive tool that will allow you to measure your carbon footprint and discover ways to reduce that footprint, try the complete Austin Carbon Footprint Calculator.

Travel

Typically, I drive ...

2400 miles per year

- SUV/Truck
- Large car/minivan
- Medium car
- Small car
- Hybrid sedan
- Small hybrid

0.75

Metric tons of CO₂ / year

Flights

In an average year, I take...

- short (< 1.5 hrs)
- medium (1.5-4 hrs)
- long (4-6 hrs)
- extended (6-12 hrs)
- super-ext (12+ hrs)

Diet

In a typical week I eat this many servings of...

- red meat
- poultry
- dairy
- seafood
- cereals + grains
- fruits, nuts + vegetables

Home

I live in a...

- Detached
- Semi-detached
- Apartment or condo

My home has...

- bedrooms
- people
- air conditioning

Total

0.75

Metric tons of CO₂ / year

7.29

Metric tons of CO₂ / year

1.04

Metric tons of CO₂ / year

10.72

Metric tons of CO₂ / year

19.80

Metric tons of CO₂ / year
